- 1. (Currently Amended) An anti-scaling device comprising a hollow central body
  2 portion mounted on a bar for rotation around a transverse axis, said bar passing through the
  3 hollow central body portion along said transverse axis, [and] several [spike units] spigots or
  4 poles extending outwardly from the body portion in different directions [wherein the] and spike
  5 units [are] each mounted [for rotation in use on the central body portion] on a said spigot or
  6 pole for rotation around axes non-congruent with the transverse axis.
  - 2. (Currently Amended) An anti-scaling device according to claim 1, wherein the spike units are detachably mounted on [the central body portion] said spigots or poles.
  - 3. (Previously Presented) An anti-scaling device according to claim 1, wherein there are pairs of spike units disposed in a diametrically opposed relationship relative to the central body portion.
  - 4. (Previously Presented) An anti-scaling device according to claim 1, wherein the central body portion has spigots for mounting the spike units.
  - 5. (Previously Presented) An anti-scaling device according to claim 1 further comprising serrated webs extending outwardly from the central body portion between the spike units.
- 6. (Previously Presented) An anti-scaling device according to claim 5, wherein the serrated webs extend along radial axes displaced 45° from the radial axes of the spike units.

- 7. (Previously Presented) An anti-scaling device according to claim 1, wherein rows of sharp-edged teeth are axially aligned along the central body portion.
- 8. (Previously Presented) An anti-scaling device according to claim 1, wherein the spike units are in the form of partially rotatable serrated propellers.
- 9. (Previously Presented) An anti-scaling device according to claim 1, wherein the spike units are pivotably mounted.
- 1 10. (Previously Presented) An anti-scaling device according to claim 1, wherein the device is moulded from a plastics material.
- 1 11. (New) An anti-scaling device comprising a central body portion mounted on a bar
  2 for rotation around a transverse axis, said bar passing through the hollow central body portion
  3 along said transverse axis, a plurality of sheaths extending in different directions from the
  4 central body portion and a two bladed propeller projecting from and rotatably mounted in each
- 5 sheath to rock backwards and forwards.
